SUMMARY

AI Engineer who ships production-grade LLM systems. Deploys fine-tuned VLMs and autonomous agents on Kubernetes with a core focus on safety, red-teaming, and adversarial robustness. Owns the full ML lifecycle from LoRA fine-tuning to zero-trust cloud deployment while maintaining 99.9% uptime. Translates research into business-ready features in Agile environments. Open to onsite.

EDUCATION

Wayne State University - Bachelor of Science, Computer Science | May 2026 | GPA: 3.4/4.0
Trustworthy AI Coursework: LoRA/QLoRA, RLHF/DPO/GRPO, Red Teaming, Machine Unlearning (TOFU/WMDP), Agentic AI Safety, Grounded VLMs (LISA/GLaMM), Chain-of-Thought Reasoning, HarmBench/SafeChain

TECHNICAL SKILLS

- AI/ML: PyTorch, TensorFlow, Hugging Face, LangChain, LoRA/QLoRA, Scikit-learn, Pandas, NumPy
- MLOps & Cloud: Kubernetes, Docker, AWS/Azure, DigitalOcean, Nginx, CI/CD, Proxmox, GPU Passthrough
- Security: Prompt Injection Defense, Red Teaming, Zero Trust, Kali Linux, Wireshark
- Languages & Tools: Python, SQL, Java, C++, JavaScript, PostgreSQL, MySQL, Git, Agile/Scrum, TDD

AI ENGINEERING PROJECTS

Secure AI Pipeline for BMI Estimation ([[Repo](#)] Apr 2026)

- Delivered an 89% accurate BMI estimation pipeline (MAE 1.24, MAPE 3.9%) by fine-tuning a 7B VLM via LoRA, compressing trainable parameters to just 35M (0.5%) and cutting inference costs by 95%.
- Architected privacy & safety with face blurring, synthetic data (BEDLAM), and LLM-as-Judge evaluations (GPT-5.4 nano), reducing hallucination/refusal rates by 40% via custom refusal mechanisms.
- Integrated LangChain for Chain-of-Thought reasoning and zero-trust input validation, exceeding HarmBench safety benchmarks.

MLOps & AI Agent Engineer | Enterprise Infrastructure (Mar 2026 - Present)

- Productionized an auto-scaling Kubernetes inference cluster (Hermes Agent and DeepSeek API) with GPU passthrough on Proxmox, achieving 99.9% uptime.
- Operationalized security by embedding red-team testing (Kali Linux) into CI/CD, proactively identifying and patching prompt injection vulnerabilities pre-production.
- Automated lead alerts via cron-driven scripts, reducing sales team response time from hours to real-time notifications.

Full-Stack Engineer | SaaS Booking Platform (On-Wheels Detailing CRM) (May 2024 - Present)

- Launched a production CRM (Python/JS) with Stripe/Telegram APIs, supporting multi-location, 6-tier pricing. Deployed on DigitalOcean with Nginx, systemd, and Cloudflare (DNS/SSL/CI/CD).
- Owned infrastructure reliability with auto-restart policies, maintaining 24/7 uptime and handling 100% of production incidents during launch.

Additional Projects:

Magna Automation Project: Production Line Employee Assignment Engine (Sep 2023 – Sep 2024)

- Architected a C++/SQLite3 matching system that assigned workers to manufacturing stations based on skill ranking, reducing manual assignment time by ~40% during shift changes.
- Implemented an `evaluateFit()` scoring algorithm that balanced line familiarity, station expertise, and employee rank to maximize operational efficiency.
- Designed the system with extensibility in mind – database driven configuration meant shift leads could reassign personnel on-system runtime without code changes.
- Built with production constraints in mind: integrated SQLite3 for persistence, used template classes for data flexibility, and included admin overrides for real-time adjustments.

PROFESSIONAL EXPERIENCE

Registered Behavior Technician | BlueMind Therapy LLC (Sep 2024 - Present)

- Operationalized iterative, data-driven decision-making by analyzing real-time behavioral data to adjust intervention plans daily -- Mirroring model drift monitoring and retraining pipelines in production.
- Managed critical incidents with rapid triage and adaptive communication, directly applicable to production on-call rotations and outage mitigation.
- Maintained 100% audit-ready compliance through meticulous session documentation, demonstrating extreme attention to regulatory data-handling standards.

Industry 4.0 / Automation Intern (Rotational) | Magna Electric Vehicle Structures (Sep 2023 - Sep 2024)

- Delivered 4 automation projects on-time and on-budget, architecting API integrations that wrote real-time production data to SQL databases for managerial reporting and audit trails.
- Accelerated part-inspection throughput by 33% and reduced post-deployment debug cycles by 25% by deploying Vuforia Model Targets for real-time CAD-to-part cross-referencing, coupled with custom C# logic for automated serialized ID validation.
- Completed a 480-hour rotational program across 2 manufacturing roles, bridging automation strategy and production KPIs to ensure cross-functional alignment and measurable operational gains.
